

Host controller and display panel communication protocol

1 Introduction

The energy storage inverter controller consists of a master controller, a slave controller, and a display panel controller. The master controller is mainly responsible for the grid-connected algorithm voltage outer loop, the Bus voltage regulation control loop, MPPT, related grid interface algorithms, power and electricity statistics, and system protection functions; the slave controller is mainly responsible for DC DCDC conversion, DC boost, master-slave Consistency detection, etc., the display board is mainly responsible for the display of system work information, so it is necessary to define the communication protocol between the main controller and the display board.

2 Definition of Communication Interface

The main controller and the display board use UART communication, the communication setting is: baud rate 115200bps, 8 data bits, 1 stop bit, no parity check, no flow control. The communication mode adopts half-duplex communication mode. At the same time, only one of the master and the slave can send data, and the other can receive data. The communication between the main controller and the display panel is initiated by the display panel, and the main controller responds (does not initiate communication actively). The communication frame is a MODBUS protocol frame.

3 Communication Frame Definition

Frame structure

Frame header	0xAA 0xAA
Slave address field	0-247 (decimal) (0 is broadcast address)
Functional domain	0x03: read multiple parameters 0x06: write a single parameter 0x10: write read multiple parameters 0x17: Master-slave synchronization data 0x41: Firmware upgrade
Data field	The data field includes the address field and the data load field
CRC field	16bit CRC check value
End of frame	0x55 0x55

Address	SIZE(Word)	register name	Type of data	magnification	Unit	Attributes	register description
001DH	1	PV1Volt	UInt16	0.1	V	R	PV1voltage

When Pv1 voltage is 300.5, Register address PV1Volt's value is 3005,

3.1 Communication frame command and frame description

The CRC check range is from the frame address to the CRC field (excluding the CRC field), and the frame header does not need to calculate the CRC check.

3.1.1 0x03 read multiple registers

The function code (command) is used to read the contents of a register in a continuous block.

The request protocol data unit specifies the starting register address and the number of registers

In the response register data, each register data contains two bytes (binary numbers are

right-justified in each byte). For each register, the first byte is high and the second byte is low.

For example request to read register 0x0001-0x0002

Request	(Hex)	Answer	(Hex)
frame header	AA	frame header	AA
	AA		AA
slave address	0A	slave address	0A
Command	03	Command	03
Register start address high order	00	number of bytes	04
Register start address low order	01	register value high (01)	0F
Register number high bit	00	register value low (01)	A0
Register count low	02	register value high (02)	01
CRC low	---	register value low (02)	C2
CRC high	---	CRC low	---
end of frame	55	CRC high	---
	55		55
		end of frame	55

3.1.2 0x06 write a single register

This function code (command) is used to write a holding register in the slave device. The request specifies the address of the register to be written.

The normal response is the reply to the request, and then returns the value written in the contents of the register.

For example, it is required to write the value of 0xAAAA to the address of register 0x0008

Request	(Hex)	Answer	(Hex)
frame header	AA	frame header	AA
	AA		AA
slave address	0A	slave address	0A

Request	06	Answer	06
Register start address high order	00	Register start address high order	00
Register start address low order	08	Register start address low order	08
register value high	AA	register value high	AA
register value low	AA	register value low	AA
CRC low	----	CRC low	----
CRC high	---	CRC high	---
end of frame	55	end of frame	55
	55		55

3.1.3 0x10 write multiple registers

This function code (command) is used to write the value of a segment (string) of consecutive addresses to the register.

The value required to be written is the requirement specified in the data field. The data is a two-byte register.

A normal response returns the function code, start address, and number of registers written.

For example, the data written to the address of register 0x0001 is data 0x1194, and the data written to the address of register 0x0002 is data 0x01CC.

Request	(Hex)	Answer	(Hex)
frame header	AA	frame header	AA
	AA		AA
slave address	0A	slave address	0A
Request	10	Request	10
Register start address high order	00	Register start address high order	00
Register start address low order	01	Register start address low order	01
Register count high	00	Register count high	00
Register count low	02	Register count low	02
number of bytes	04	CRC low	----
register value high (01)	11	CRC high	---
register value low (01)	94	end of frame	55
register value high (02)	01		55
register value low (02)	CC		
CRC low	----		

CRC high	---		
end of frame	55		
	55		

3.1.4 0x17Read/write multiple registers (master-slave synchronous data)

This function code (command) is used to perform one read operation and one write operation in a single transfer, and read and write multiple data.

For example:

Request	(Hex)	Answer	(Hex)
frame header	AA	frame header	AA
	AA		AA
slave address	11	slave address	11
Command	17	Command	17
Read register start address high order	00	number of bytes	0C
Read register start address low order	04	register value high (04)	00
Read the high order of the number of registers	00	register value low (04)	FE
Read the low order of the number of registers	06	register value high (05)	0A
Write register start address high order	00	register value low (05)	CD
Write register start address low order	0F	register value high (06)	00
Write register number high bit	00	register value low (06)	01
Write register count low	03	register value high (07)	00
number of bytes	06	register value low (07)	03
Write register value high (0F)	00	register value high (08)	00
Write register value	FF	register value low	0D

low (0F)		(08)	
Write register value high (10)	00	register value high (09)	00
Write register value low (10)	FF	register value low (09)	FF
Write register value high (11)	00	CRC low	---
Write register value low (11)	FF	CRC high	---
CRC low	---	end of frame	55
CRC high	---		55
end of frame	55		
	55		

3.1.5 Error Response Frame Definition

•Once the slave (server) receives the request, there are two types of responses according to the processing result:

The code of the response function responds to the request function code.

•abnormal response:

In an abnormal response, the server sets the highest position of the function code to 1.

Return the function code value + 0x80 to the exception code.

exception code:

error code (Hex)	describe
01	illegal function code
02	invalid request address
03	Illegal request data value
04	server failure
06	server is busy
10	wrong password
11	Check error
12	Invalid argument
13	system locked

For example: the master reads data, and the slave responds abnormally.

Request	(Hex)	Response	(Hex)
frame header	AA	frame header	AA
	AA		AA
slave address	0A	slave address	0A

Command	03	Command	83
Register start address high order	00	error code	02
Register start address low order	01	CRC Low	---
Register number high bit	00	CRC High	---
Register count low	02	end of frame	55
CRC Low	---		55
CRC High	---		
end of frame	55		
	55		

4 Inverter Data Register Definition

4.1 Information register definition

address	SIZE(Word)	register name	type of data	magnitude	unit	Attributes	register description	Remark
8F00H	1	Type	UInt16	0		R	DeviceType	0x0052:Single-phase AC coupling integrated machine AS1 series
8F01H	1	SubType	UInt16			R	Subclass	
8F02H	1	CommProVersion	UInt16	-3		R	Comms Protocol Version	
8F03H	10	SN	String(20)			R	SerialNumber	invalid value: 0x00
8F0DH	10	PC	String(20)			R	ProductCode	invalid value: 0x00

332CH	1	GridFreqLow2	UInt16	-2	Hz	R/W	GridFreqLow2	
332DH	1	GridVoltHighTripTime	UInt16	0	20ms	R/W	GridVoltHighTripTime	Unit 20ms For example: A value of 50 corresponds to 1000ms
332EH	1	GridVoltLowTripTime	UInt16	0	20ms	R/W	GridVoltLowTripTime	

332FH	1	GridVoltHighTripTime2	UInt16	0	20ms	R/W	GridVoltHighTripTime2	
3330H	1	GridVoltLowTripTime2	UInt16	0	20ms	R/W	GridVoltLowTripTime2	
3331H	1	GridFreqHighTripTime	UInt16	0	20ms	R/W	GridFreqHighTripTime	
3332H	1	GridFreqLowTripTime	UInt16	0	20ms	R/W	GridFreqLowTripTime	
3333H	1	GridFreqHighTripTime2	UInt16	0	20ms	R/W	GridFreqHighTripTime2	
3334H	1	GridFreqLowTripTime2	UInt16	0	20ms	R/W	GridFreqLowTripTime2	
3335H	1	PowerAdjCoff1	UInt16	0		R/W	PowerAdjCoff1	
3336H	1	PowerAdjCoff2	UInt16	0		R/W	PowerAdjCoff2	
3337H	1	InverterStop	UInt16	0		R/W	InverterStop	
3338H	1	FunMaskEx	UInt16	0		R/W	FunMaskEx	
3348H	1	GridChargPowerLimit	UInt16	0	W	R/W	GridChargPowerLimit	Default 2500W
3349H	1	GridFeedPowerLimit	UInt16	0	W	R/W	GridFeedPowerLimit	Default 2500W
334AH	1	BatType	UInt16	0		R/W	BatType	Default 0, 0=lead-acid battery, 1=lithium battery
334BH	1	BatCapacity	UInt16	0	AH	R/W	BatCapacity	Default 100AH
334CH	1	BatProtHigh	UInt16	-1	V	R/W	BatProtHigh	Default 60V, 50~60V
334DH	1	BatProtLow	UInt16	-1	V	R/W	BatProtLow	Default 46V, 40~52V
334EH	1	BatOpenVolt	UInt16	-1	V	R/W	BatOpenVolt	Default 38V, 12~42V
334FH	1	BatLowVolt	UInt16	-1	V	R/W	BatLowVolt	Default 42V, 40~48V
3350H	1	BatDisDepth	UInt16	0	%	R/W	BatDisDepth	Default 80%, 20~95% Valid in off-grid mode
3351H	1	BatFloatVolt	UInt16	-1	V	R/W	BatFloatVolt	Default 54V, 48~58V
3352H	1	BatFloatTime	UInt16	0	min	R/W	BatFloatTime	Default 120, 0~65535
3353H	1	BatChgCurrLimit	UInt16	-1	A	R/W	BatChgCurrLimit	Default 50A, 5~50A
3354H	1	BatDisCurrLimit	UInt16	-1	A	R/W	BatDisCurrLimit	Default 100A, 5~120A
3355H	1	BatAutoWakeEn	UInt16	0		R/W	BatAutoWakeEn	The default is 0, 0=disable, 1=enable, only allow setting when the battery type is lithium battery
3371H	1	ACC_UserMode	UInt16	0		R/W	ACC_UserMode	1: Automatic scheduling mode 2: Time-of-use electricity pricing model 3: Backup mode

								4: Manual maintenance mode
3372H	1	ACC_EPSEn	UInt16	0		R/W	ACC_EPSEn	0: Disable; 1: Enable
3373H	1	ACC_BatSetSOC_H	UInt16	0	%	R/W	ACC_BatSetSOC_H	The default value is 80, which is valid in grid-connected mode.
3374H	1	ACC_BatSetSOC_L	UInt16	0	%	R/W	ACC_BatSetSOC_L	The default value is 40, which is valid in grid-connected mode.
3375H	1	CommProtocolType	UInt16	0		R/W	CommProtocolType	1: SAJ 2: Alpha.ESS
3376H	1	SafetyModeCtrl	UInt16	0		R/W	SafetyModeCtrl	Bit 10 (DRM enable bit): 0: Off 1: On
3377H	1	BackModSOCRetain	UInt16	0	%	R/W	BackModSOCRetain	Default 80
3378H	1	DRMCertification	UInt16	0		R/W	DRMCertification	0: AS4777.2 1: AS4755.3

362AH	1	Sixth_discharge_start_time	HEX	0		R/W	Article 6 Discharge start time	The high byte is the hour, the low byte is the minute; hh: mm

362BH	1	Sixth_discharge_end_time	HEX	0		R/W	Article 6 Discharge end time	The high byte is the hour, the low byte is the minute; hh: mm
362CH	1	Sixth_discharge_power_time	HEX	0		R/W	Article 6 Discharge start time	The high byte indicates the day of the week, and each bit is enabled, such as 0b0100, which indicates Wednesday; the low byte indicates the power, such as 1, which indicates 1% of the standard power of the model.
362DH	1	Seventh_discharge_start_time	HEX	0		R/W	Article 7 Discharge start time	The high byte is the hour, the low byte is the minute; hh: mm
362EH	1	Seventh_discharge_end_time	HEX	0		R/W	Article 7 Discharge end time	The high byte is the hour, the low byte is the minute; hh: mm
362FH	1	Seventh_discharge_power_time	HEX	0		R/W	Article 7 Discharge date and power	The high byte indicates the day of the week, and each bit is enabled, such as 0b0100, which indicates Wednesday; the low byte indicates the power, such as 1, which indicates 1% of the standard power of the model.
3630H	1	Meter_enable	Uint16	0		R/W	Meter enable	0: disable, 1: 1 meter 2: 2 meters
3631H	1	Meter_addr	Uint16	0		R/W	The communication address of the meter	1 - 255
3632H	1	Buzzer_on-off	Uint16	0		R/W	Buzzer switch enable	0: enable, 1: disable
3633H	1	RS485_Addr	Uint16			R/W	RS485 communication address	1~127
3634H	1	RS485_BaudRate	Uint16			R/W	RS485 Communication baud rate	0 is 9600, 1 is 4800, 2 is 2400, 3 is 1200

4.6 Error Code definition

Code	Host fault code definition(EN)	Host fault code definition(EN)
1	Lost Com.M<->S Err	Lost Com.M<->S Err
2	Temp.High Err	Temp.High Err
3	Temp.Low Err	Temp.Low Err
4	DCI Err	DCI Err
5	SynPulse Err	SynPulse Err
6	Relay Err	Relay Err
7	Eeprom Err	Eeprom Err
8	Bat Input Short Err	Bat Input Short Err

4.7 BMS Error Code definition

	Falut MSG	Warn MSG
Bit 0	Reserved	Reserved
Bit 1	Over voltage	High voltage
Bit 2	Under voltage	Low voltage
Bit 3	Over temp.	High temp.
Bit 4	Under temp.	Low temp.
Bit 5	Over MOSFET temp.	Over MOSFET temp.
Bit 6	Over environment temp.	Over environment temp.
Bit 7	Over current discharge	High current discharge
Bit 8	Over current charge	High current charge
Bit 9	Short circuit	Short circuit
Bit 10	Reserved	Reserved
Bit 11	BMS internal	BMS internal
Bit 12	Voltage detection failure	Reserved
Bit 13	Current detection failure	Reserved
Bit 14	Temp. detection failure	Reserved
Bit 15	MOSFET detection failure	Reserved

4.8 0x3309 register definition

Address	BIT	Register name	type of data	magnification	Unit	Attributes	register description	Remark
0x3309	bit0	RelayCheck		0			Relay detection enable bit	0=disable、1=enable
	bit1	ISOCheck		0			ISO detection enable bit	0=disable、1=enable
	bit2	GFCIDevCheck		0			Earth leakage current device self-check enable bit	0=disable、1=enable
	bit3	GFCICheck		0			Earth leakage current detection enable bit	0=disable、1=enable
	bit4	DciCheck		0			Grid current DC component detection	0=disable、1=enable

						enable bit	
bit5	DciAdjust		0			Grid current DC component control enable bit	0=disable、1=enable
bit6	AntiIsland		0			Active Islanding Detection Enable Bit	0=disable、1=enable
bit7	FANCheck		0			Fan Detection Enable Bit	0=disable、1=enable
bit8	Rsvd8		0			Reserved8	0=disable、1=enable
bit9	Rsvd9		0			Reserved9	0=disable、1=enable
bit10	Rsvd10		0			Reserved10	0=disable、1=enable
bit11	LNPECheck		0			Grid connection detection enable bit	0=disable、1=enable
bit12	DviAdjust		0			Output voltage DC component control enable bit	0=disable、1=enable
bit13	OutInsertCheck		0			Output abnormal access detection enable bit	0=disable、1=enable
bit14	InvWaveCheck		0			Inverter wave detection enable bit	0=disable、1=enable
bit15	PvLoadFuncEn		0			PV Independent Load Enable Bit	0=disable、1=enable
